-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-2 are rejected under 35 U.S.C. 102(b) as being anticipated by **Nishimura et al. (JP 08-201010)**.

Nishimura et al. discloses a vibration detecting system of a resilient body comprising a detector (6) for detecting the vibration of the resilient body (4) and outputting a detection signal in accordance with the vibration; a magnetic circuit (see Figures 3-8) having a primary coil and a secondary coil, the primary coil and the secondary coil being in close electromagnetic connection; wherein the vibration of the resilient body is detected using an output signal generated the secondary coil when the detection signal from the detector is received by the primary coil; and wherein the detector is located around the resilient body and includes a non-contact detecting element for detecting the vibration of the resilient body in a non-contact manner (see Figure 12 and 13).

As for claim 2, **Nishimura et al.** discloses the detector being attached to the resilient body (see Figures 3-8). It is inherent in the system disclosed that the detector (6) comprise a piezoelectric element or a strain detecting element as both are known and used throughout the art of stylus vibration detection for determining the vibration of the stylus or resilient body when placed in direct contact with the vibrating body. One of ordinary skill in the art would recognize such a detecting section as including either a piezoelectric element or a strain detecting element.
